

# BARR/RJE Host Definition Information

June 11, 2006

For BARR/RJE to communicate with your host, you must define BARR/RJE to your host as one or more RJE remotes. Each RJE remote requires a separate host definition. Two separate programs on the host must be updated – VTAM, which controls all SNA communication, and the job entry system, JES2, JES3, or POWER.

To configure BARR/RJE, the host programmer should record information for VTAM and the job entry system in the space provided. Some of the same parameters will be entered in BARR/RJE, so it is important that the host and remote parameters match. Host programmers should refer to the *BARR/RJE Host Definition Guide* for help configuring the host for RJE.

## VTAM host configuration

Sample VTAM definitions are provided when you configure the communication link in the RJE Configuration Utility.

For each Barr remote, enter the following PU and LU definitions in VTAM.

### 802.2 LLC2

Parameters	Sample VTAM Definition		
1. LOCADD:_____	linename	LINE	ADDRESS=(aaaa,FULL), <b>LOCADD=400000000001,</b> PORTADD=pp,RCVBUFC=4095

## Host configuration

Recommended remote definitions are provided when you enter the RJE description in the RJE Configuration Utility.

Your host programmer must enter the parameters for your job entry system.
